Clarifications:

In the initial specifications document, a few entities were left out of the entity list, but shown in a rough ER diagram at the end. These entities have also been included in the final ER diagram, as they were required to ensure connectivity of the database.

Our team used draw.io, which didn't have functionality for subclasses. Hence, the subclasses are represented by a line connecting two entities, which has a label "SUBCLASS". For entities which had both primary keys and candidate keys, the primary key attribute(s) are labeled with a "PK" on top of them. If no "PK" is mentioned, all underlined attributes form a primary key together.

A link to the the ER diagram is provided [here](#). An image is attached in the next page.
